

# Climate Risk Report

June 29, 2024

Portfolio Name: MI SOMERSET ASIA INCOME FUND

Benchmark Name: MSCI AC World
Analysis Date: December 29 2023

Currency: GBP

# **About this report**

This report is designed to provide institutional investors with transparency into their portfolios' climate-related risks and opportunities according to the recommendations from the Task Force on Climate-related Financial Disclosures (TCFD). With climate-related risks posing a potential threat to the long term resilience of investment portfolios and with climate reporting frameworks and regulations gaining momentum, there is a growing focus on climate risk management practices and disclosures.

This report aims to help investors understand their exposure to these risks and opportunities, one of the key aspects of the TCFD recommendations and an essential step in a Net Zero journey.

This report combines both current exposure climate data and forward looking metrics.

Disclaimer: TCFD data is not available for all Fund holdings. The material in this TCFD Report has been prepared with information available to specialist TCFD data providers and may not be reflective of the Fund's entire TCFD position. The analysis contained in this report has been made against a generic MSCIAC World index and the comparisons are not being made to the actual fund benchmarks.

### CO<sub>2</sub>

#### **Footprint Metrics on Investor Allocation Definitions**

EVIC: Enterprise Value Including Cash (EVIC) is an alternate measure to Enterprise Value (EV) to estimate the value of a company by adding back cash and cash equivalents to EV.

EVIC = Market capitalization at fiscal year-end date + preferred stock + minority interest + total debt + cash and cash equivalents

The underlying data used for EVIC calculation is sourced from a company's accounting year-end annual filings. EVIC is updated and reflected once a year as the data is sourced annually.

Financed Carbon Emissions tons CO2e / GBP M invested Allocated emissions to all financiers (EVIC) normalized by \$m invested. Measures the carbon emissions, for which an investor is responsible, per GBP million invested, by their equity ownership. Emissions are apportioned based on equity ownership (%market capitalization).

$$\frac{\sum_{n}^{i} \left(\frac{current\ value\ of\ investment_{i}}{issuer's\ EVIC_{i}} \times issuer's\ Scope\ 1\ and\ Scope\ 2\ GHG\ emissions_{i}\right)}{current\ portfolio\ value\ (\$M)}$$

 Total Financed Carbon Emissions tons CO2e Allocated emissions to all financiers (EVIC). Measures the total carbon emissions for which an investor is responsible by their equity ownership. Emissions are apportioned based on equity ownership (%market capitalization).

$$\sum_{n}^{i} \left( \frac{current \ value \ of \ investment_{i}}{issuer's \ EVIC_{i}} \times issuer's \ Scope \ 1 \ and \ Scope \ 2 \ GHG \ emissions_{i} \right)$$

Financed Carbon Intensity tons CO2e / GBP M sales Allocated emissions per allocated sales. Measures the carbon efficiency of a portfolio, defined as the ratio of carbon emissions for which an investor is responsible to the sales for which an investor has a claim by their equity ownership. Emissions and sales are apportioned based on equity ownership (%market capitalization).

$$\frac{\sum_{n}^{i} \left(\frac{current\ value\ of\ investment_{i}}{issuer's\ EVIC_{i}} \times issuer's\ Scope\ 1\ and\ Scope\ 2\ GHG\ emissions_{i}\right)}{\sum_{n}^{i} \left(\frac{current\ value\ of\ investment_{i}}{issuer's\ EVIC_{i}} \times issuer's\ \$M\ revenue_{i}\right)}$$

#### Weighted Average Carbon Intensity Definitions

 Corporate constituents tons CO2e / GBP M sales Measures a portfolio's exposure to carbon-intensive companies, defined as the portfolio weighted average of companies' Carbon Intensity (emissions/sales).

$$\sum_{n}^{i} \left( \frac{current \ value \ of \ investment_{i}}{current \ portfolio \ value} \times \frac{issuer's \ Scope \ 1 \ and \ Scope \ 2 \ GHG \ emissions_{i}}{issuer's \ \$M \ revenue_{i}} \right)$$

Sovereign constituents tons CO2e / GBP M GDP nominal Measures a portfolio's exposure to carbon-intensive economies, defined as the portfolio weighted average of sovereigns' GHG Intensity (emissions/GDP).

$$\sum_{n}^{i} \left( \frac{current\ value\ of\ investment_{i}}{current\ portfolio\ value} \times \frac{sovereign\ issuer's\ GHG\ emissions_{i}}{sovereign\ issuer's\ \$M\ GDP_{i}} \right)$$

#### Fossil Fuel Based and Green Revenue Summary

#### **Understanding Fossil Fuel Based Revenue**

Fossil fuel-based revenue is the weighted average of revenue exposure to thermal coal extraction, unconventional and conventional O&G extraction, O&G refining as well as revenue from the thermal coal power generation.

#### **Understanding Green Revenue**

Green revenue is the weighted average of revenue exposure to alternative energy, energy efficiency, green building, pollution prevention, sustainable water and sustainable agriculture.

**]**=

#### **MSCI Implied Temperature Rise**

Implied Temperature Rise (ITR) provides a portfolio level number in degrees of Celsius demonstrating how aligned the companies in the portfolio are to global temperature goals.

 The Implied Temperature Rise (ITR) metric provides an indication of how well public companies align with global temperature goals. Expressed in degrees Celsius, it is an intuitive, forward-looking metric that shows how a company aligns with the ambitions of the Paris Agreement — which is to keep a global temperature rise this century well below 2°C above pre-industrial levels and to pursue efforts to limit the temperature increase even further to 1.5°C.

The portfolio-level Implied Temperature Rise uses an aggregated budget approach: it compares the sum of "owned" projected GHG emissions against the sum of "owned" carbon budgets for the underlying fund holdings. The portfolio's total estimated carbon budget over-/undershoot is then converted to a degree of temperature rise (°C) using science based TCRE (Transient Climate Response to Cumulative Emissions). The allocation base used to define ownership is Enterprise Value including Cash (EVIC) in order to enable the analysis of equity and corporate bond portfolios.

## Portfolio MSCI Implied Temperature Rise Distribution

The issuers in the portfolio are distributed according to their Implied Temperature Rise showing the number who are aligned with the Paris Agreement and the more ambitious 1.5°C temperature goal.

Implied Temperature	% of companies in category	
1.5°C Aligned	<= 1.5°C	8.9%
2°C Aligned	> 1.5°C - 2°C	11.1%
Misaligned	>2.0 - 3.2°C	53.3%
Strongly Misali	gned >3.2°C	26.7%

20% of companies within the portfolio (vs. 41.5% for the benchmark) align with the goal of limiting temperature increase to below 2°C.

**8.9%** of companies within the portfolio (vs. 14.9% for the benchmark) align with the goal of limiting temperature increase to below 1.5°C.

#### Weighted Average Carbon Intensity (S1+S2 tCO2 / GBP M sales) - Attribution Analysis

#### Understanding carbon attribution analysis

In attribution analysis of carbon footprints, negative values represent areas that contribute to a smaller footprint relative to the benchmark, while positive values contribute to a larger relative footprint.

- **Sector Allocation** measures the impact of a manager's decisions to over- or underweight portfolio sectors relative to a benchmark. Negative values come from underweighting sectors with higher carbon footprints than the benchmark or overweighting sectors with carbon footprints lower than the benchmark.
- **Stock Selection** measures the impact of a manager's security selection within a sector relative to a benchmark. Negative values in a sector come from selecting companies with lower footprints relative to those in the benchmark. The weight of the sector in the benchmark determines the size of the effect.
- Interaction measures the combined impact of a manager's allocation and stock selection within a sector. For example, overweighting a sector with a lower carbon footprint relative to the benchmark results in negative interaction, while underweighting a sector with a lower relative carbon footprint leads to a positive interaction effect.

Benchmark: MSCI AC World

#### **Low Carbon Transition Categories**

#### **Exposure to Low Carbon Solutions**

#### **Exposure to Low Carbon Transition Risk**

Identifies the portfolio's market value exposed to companies that have potential to benefit through the growth and demand for low carbon products and services. These typically include companies that offer renewable electricity, electric vehicles, solar cell manufacturers

Identifies the portfolio's market value exposed to companies with increased operations and/or capital costs (operational transition), facing reduced demand for carbon-intensive products (product transition), and companies with potential stranding of physical/ natural assets due to regulatory, market or technology forces.

#### **Understanding MSCI Low Carbon Transition Risk Assessment**

The Intergovernmental Panel on Climate Change (IPCC) Special Report on Global Warming of 1.5°C published in October 2018 re-iterated that achieving the Paris agreement target of 1.50°C warming level would require rapid, farreaching and unprecedented transitions in all aspects of society. The "Low Carbon Transition" refers to the necessary transition of the global economy from carbon intensive operations and energy sources to zero or low carbon operations and energy sources.

MSCI Low Carbon Transition Categories classify companies in five categories that highlight the predominant risks and opportunities they are most likely to face in the transition to a low carbon economy (See categories to the right).

#### Solutions

Companies that have potential to benefit through the growth of low-carbon products and services.

Examples include renewable electricity, electric vehicles, solar cell manufacturers etc.

Currency: GBP

#### **Operation Transition**

Companies with increased operation and/or capital cost due to carbon taxes and/or investment in carbon emission mitigation measures leading to lower profitability of the companies.

Examples include fossil fuel based power generation, cement, steel etc.

#### **Product Transition**

Companies that face reduced demand for carbon-intensive products and services. Leaders and laggards are defined by the ability to shift product portfolio to low-carbon products. Examples include Oil & gas exploration & production; Petrol/diesel based automobile manufacturers, thermal power plant turbine manufacturers etc.

#### Asset Stranding

Potential to experience "stranding" of physical/natural assets due to regulatory, market or technological forces arising from low-carbon transition. Examples include coal mining & coal based power generation; Oil sands exploration/production

June 29 2024 11 of 25

Portfolio: MI SOMERSET ASIA INCOME FUND

Benchmark: MSCI AC World

#### **Understanding Fossil Fuel-based Revenue Exposure**

The reduced demand for carbon-intensive products and services could lead to financial stress and asset stranding in carbon-intensive industries. It is estimated that a low-carbon transition could put assets worth USD 25 trillion at risk of stranding in the fossil fuel industry alone (source: "2020 vision: why you should see peak fossil fuels coming" Carbon Tracker, Sept. 2018).

Historically, investors have focused much attention on the carbon-intensive industries that could be directly affected by a potential low-carbon transition: fossil-fuel-based power generation, coal mining and oil and gas production and refining.

#### Weighted Average Fossil Fuel-based Revenue Exposure

#### Portfolio Top 5 Companies with Highest Proportion of Fossil Fuel Revenues

	Weight Fossil Fuel Theme	Fossil Fuel Revenue
THAI OIL PCL	1.5% O&G Refining, Generation Fossil Fuels	86.4%
CNOOC LTD	3.8% Unconventional O&G,Conventional O&G,	24.2%
TAIWAN CEMENT CORP.	2.1% Generation Fossil Fuels	22.9%

Benchmark: MSCI AC World

#### Weighted Average Green Revenue Exposure

## Portfolio Top 5 Companies with Highest Proportion of Green Revenues

	Weight Green Revenue Theme	Green Revenue
LENDLEASE GLOBAL COMMERCI	1.4% Green Building,	79.9%
MINDSPACE BUSINESS PARKS	0.8% Green Building,	55.2%
SUNTEC REAL ESTATE INV	1.0% Green Building,	47.5%
DEXUS PROPERTY GROUP	1.4% Green Building,	27.3%
LG CHEM LTD-PREFERENCE	2.8% Alternative Energy, Energy Efficiency, Sustainable Water,	21.7%

#### **Understanding Green Revenue Exposure**

Companies and industries whose products and operations are well positioned for the transition (e.g. renewable-energy producers and electric-vehicle manufacturers) could see increased demand for their products and services in the low-carbon transition.

Currency: GBP

For instance in 2016, solar-photovoltaic additions rose faster than for those of any other fuel - and even surpassed the net growth in coal-fired power plants (source: "Renewables 2017" International Energy Agency, Oct 2017).

A similar trend has been observed in the automobile industry as well, where the demand for electric cars has grown by more than 40% per year since 2010 (source: Global EV Outlook 2017, International Energy Agency).

June 29 2024 13 of 25

Portfolio: MI SOMERSET ASIA INCOME FUND

Benchmark: MSCI AC World

Oil & Gas Exposure Unconventional Oil & Gas Exposure

#### Oil & Gas Outlook

Demand for oil and gas in a low carbon world is forecast to decline under low carbon scenarios (IEA SDS), leading to potentially stranded assets.

#### Oil and Gas Revenue & Reserves Exposure

There are several ways to determine a portfolio's exposure to oil and gas. Any tie is the broadest indicator encompassing activities related to oil and gas reserves ownership, revenue derived from oil and gas production, and ownership of or by oil and gas companies.

#### **Unconventional Oil and Gas**

We classify oil sands, shale gas and shale oil as unconventional. Oil sands and shale oil are arguably more exposed to stranded assets risk as they have a higher carbon content than other types of oil and gas. In addition to higher carbon intensity, the extraction of unconventional sources of oil and gas can be costly because of various geological, technical and environmental challenges.

June 29 2024 14 of 25

Portfolio: MI SOMERSET ASIA INCOME FUND

Benchmark: MSCI AC World

#### **Exposure to Power Generation - Apportioned Fuel Mix**

#### **Understanding Power Generation - Apportioned Fuel Mix**

The Paris Agreement calls for coordinated efforts ensuring global temperature rise as a result of GHG emissions is limited to 1.5°C or below. Analytical results vary, but most Paris-aligned scenarios require industrial carbon emissions peaking in the 2020s and reducing rapidly thereafter, leading to a net-zero industrial emissions in the second half of this century.

June 29 2024 15 of 25

Portfolio: MI SOMERSET ASIA INCOME FUND

Benchmark: MSCI AC World

#### Exposure to Holdings Deriving Revenues From Fossil Fuel

### Thermal Coal Conventional O&G Unconventional O&G Generation Fossil Fuel

Shows the portfolios market value exposed to companies that derive revenue from the mining of thermal coal (including lignite, bituminous, anthracite and steam coal) and its sale to external parties, and contract mining services.

Shows the portfolios market value exposed to companies that derive revenue from conventional oil and gas. It includes all types of conventional oil and gas production including Arctic onshore/offshore, deepwater, shallow water and other onshore/offshore. It excludes revenues from unconventional oil & gas.

Shows the portfolios market value exposed to companies that derive revenue from unconventional oil and gas. It includes revenues from oil sands, oil shale (kerogen-rich deposits), shale gas, shale oil, coal seam gas, and coal bed methane. It excludes all types of conventional oil and gas production.

Shows the portfolios market value exposed to companies that derive revenue from power generation based on fossil fuel (thermal coal, liquid fuel and natural gas).

# Adaptive Capacity: Risk Management Assessment

Portfolio: MI SOMERSET ASIA INCOME FUND

Benchmark: MSCI AC World

#### **Understanding Carbon Risk Management Initiatives**

Companies have a variety of strategies to reduce emissions, including setting targets for reductions, using cleaner energy sources and managing energy consumption

While these efforts vary considerably across companies, we categorize them as No Efforts, Some Efforts, and Aggressive Efforts to make them more comparable

#### **Implied Temperature Rise**

The Implied Temperature Rise (ITR) metric provides an indication of how well public companies align with global temperature goals. Expressed in degrees Celsius, it is an intuitive, forward-looking metric that shows how a company aligns with the ambitions of the Paris Agreement -which is to keep a global temperature rise this century well below 2°C above pre-industrial levels and to pursue efforts to limit the temperature increase even further to 1.5°C. The portfolio-level Implied Temperature Rise compares the sum of "owned" projected GHG emissions against the sum of "owned" carbon budgets for the underlying fund holdings. The portfolio's total estimated carbon budget over-/ undershoot is then converted to a degree of temperature rise (°C) using the TCRE. The allocation base used to define ownership is Enterprise Value including Cash (EVIC) in order to enable the analysis of equity and corporate bond portfolios.

#### Aggregated Implied Temperature Rise by Industry Group

#### Aggregated Implied Temperature Rise Spread by Industry Group

The chart above displays the Industry Groups in this portfolio that are associated with the highest aggregated Implied Temperature Rise (ITR). The light blue bars are a measure of the maximum and minimum aggregated ITR per group. Each gray bar represents either the average level of aggregated ITR per group or the benchmark portfolio's aggregated ITR per group (if specified). Each dark blue dot represents the ITR of this portfolio, taking into account holding weights. Use this graphic to identify a group's current deviation from global climate goals and find Industry Groups where climate goal alignment is most feasible. Company and portfolio level Implied Temperature Rises are floored and capped at 1.3°C and 10°C.

1p5C NGFS Disorderly	0.00%	0.00%	0.00%
2C NGFS Orderly	0.00%	0.00%	0.00%
2C NGFS Disorderly	0.00%	0.00%	0.00%
3C NGFS Current Policies	0.00%	0.00%	0.00%
3C NGFS	0.00%	0.00%	0.00%
Coverage	0.00%	0.00%	0.00%

#### Coverage is 0.00% for the portfolio, 0.00% for the benchmark.

Coverage here denotes total portfolio coverage across all asset classes, not only the sovereign portion of the portfolio. The coverage metrics presented in this report are computed in the context of the entire long-only side of the portfolio - no weight adjustments are performed for the respective scopes of corporate or sovereign exposures.

#### **Understanding Sovereign Climate VaR**

Sovereign Bond Climate VaR is designed to provide a forward-looking and return-based valuation assessment to measure climate related risks in a sovereign bond investment portfolio. The fully quantitative model offers insights into how climate change could affect sovereign bond valuations through the use of a stress testing framework.

It estimates the change in the sovereign yield curve when market expectations move from a climate-agnostic baseline expectation to any other climate scenario. Yield curve changes are then used to stress test the value of local-currency sovereign bonds.

The model produces two types of outputs: the potential impact of climate change and economic decarbonization on implied yield curves and sovereign bond valuations.

Benchmark: MSCI AC World

MSCI Climate Change metrics evaluates approximately 10,000+ companies covering the MSCI ACWI IMI. The data availability in the report analysis is the result of two subsequent mappings:

Step 1. Security mapping with MSCI security master when the portfolio is initially uploaded to ESG Manager (out of scope/matched).

Step 2. Security mapping when the portfolio template is run in the analysis tab – the matched securities from step 1 are checked against the data available as of the date of the analysis. While we are aiming to align coverage for all climate datasets, the coverage results may vary depending on the dataset and are detailed in the table below.

#### Availability & quality of carbon emission data

For Scope 1 & 2, when reported data is not available, Scope 1 & 2 carbon emissions are estimated using MSCI's Scope 1 & 2 estimation model which we have mapped to the data quality score defined by PCAF.

Note: All Scope 3 emissions used in this report are estimated by MSCI's S3 estimation model, due to un-usability (inconsistency, volatility) of the reported Scope 3

Sector Weight to Financed Carbon Emissions (S1+S2)

#### Market Cap Weight

The column chart shows the composition by sector of the portfolio and benchmarks by market capitalization to financed carbon emissions. This highlights that dominant sectors, in terms of emissions, tend to be Energy, Utilities, and Materials.

The sector table shows the comparison of the portfolio sector emissions (Scope 1 + Scope 2) to those of the benchmark. The key denotes the magnitude of the emissions in each sector with green denoting lower emissions, and red denoting higher emissions in that sector.

#### Sectoral Contribution to Financed Carbon Emissions (S1+S2)

	Portfolio	Benchmark
Communication Services	3.5%	0.7%
Consumer Discretionary	2.1%	2.8%
Energy	9.7%	21.5%
■ Financials	0.3%	1.5%
Health Care	1.8%	0.8%
Industrials	18.6%	8.1%
Information Technology	11.8%	3.2%
Materials	51.6%	32.6%
Real Estate	0.5%	0.4%

Contribution to Financed Carbon Emissions

The pie chart shows the composition by each sector's contribution to financed carbon emissions. This highlights that dominant sectors, in terms of emissions, tend to be Energy, Utilities, and Materials.
